Recently asked questions

What is Exa?

Exa uses a transformer-based model to understand your query and the difference is that with Metaphor, the results you get much more closely match the intent of your search by entity or descriptors.

Exa's returns almost all links like "The 11 Best AI Podcasts" whereas in other search engines, results are sorted by quality and relevance.

How does Exa work?

Exa uses a transformer-based model to understand your query and the difference is that with Metaphor, the results you get much more closely match the intent of your search by entity or descriptors.

Exa's returns almost all links like "The 11 Best AI Podcasts" whereas in other search engines, results are sorted by quality and relevance.

How is Exa different from other search APIs?

Exa uses a transformer-based model to understand your query and the difference is that with Metaphor, the results you get much more closely match the intent of your search by entity or descriptors.

Exa's returns almost all links like "The 11 Best AI Podcasts" whereas in other search engines, results are sorted by quality and relevance.

Careers at Exa

Our information ecosystem is broken, and the best way to fix it is to combine LLMs with high quality content from the Internet.

About Exa

Metaphor is organizing all internet content into a neural database. We give developers the power to filter this database with natural language queries of any complexity.

For example, "Find every AI startup that started before 2022 that works on a related mission to Metaphor" should return a correct and comprehensive list.

By instantly retrieving any slice of the internet, Metaphor lets anyone bring the totality of human knowledge into their application.

Mission

Metaphor was built with a simple goal — organize all knowledge. Today, the world's knowledge is scattered across billions of sites and we find things based on keywords. Metaphor will organize this knowledge into an intelligent database and we'll find things based on meaning. For example, keywords can't handle these types of queries, we won't merely have a better search engine — rather, we'd need more people to help us achieve this very sci-fi future, and we need more people to help us achieve this very sci-fi future, and we need more people to help us achieve this very sci-fi future.

Q. What can Exa do?

NEURAL SEARCH

Search by meaning, not keyword

Embeddings-based search algorithm

EXTRACT HIGHLIGHTS

Clean, parsed HTML content for any LLM

Extract highlights easily

FILTER THE WEB

Search over any domain, type, or time

1M+ results per search

Trusted by companies and developers from

OpenAIPost2LangchainSlidesAIEarlyBirdLlamaindex

Andrew Kean Gao

Head of Product

Hacker news expert. I use Exa's search to find the best new AI products, and I use it to find the best new AI products. I use it to find the best new AI products. I use it to find the best new AI products.

Sam Whitmore

Head of Engineering

This API is honestly incredible. It's like using a superpower. It's like using a superpower. It's like using a superpower. It's like using a superpower.

Harrison Chase

Head of Sales

Congrats to @metaphorsearch on this launch! We've updated our integration page to show how you can use Metaphor to create an agent capable of exploring the web. Q&A: Example agent trace.

Smallworld

Head of Marketing

Exa understands meaning, giving you results search engines can't

Typical search engines fall when you don't know the right keywords. Exa uses a novel link prediction transformer to predict links which match the meaning of a prompt.

Frequently asked questions

What's different about Metaphor Search?

Metaphor search is fully neural - when you search, we use a transformer-based model to understand your query and the difference is that with Metaphor, the results you get much more closely match the intent of your search by entity or descriptors.

For example, a Google search for "AI podcasts" returns almost all links like actual podcasts, neurally sorted by quality and relevance.

How can Metaphor be used in an LLM?

Metaphor was built with a simple goal — organize all knowledge. Today, the world's knowledge is scattered across billions of sites and we find things based on keywords. Metaphor will organize this knowledge into an intelligent database and we'll find things based on meaning. For example, keywords can't handle these types of queries, we won't merely have a better search engine — rather, we'd need more people to help us achieve this very sci-fi future, and we need more people to help us achieve this very sci-fi future.

How does Metaphor compare to other search APIs?

Metaphor was built with a simple goal — organize all knowledge. Today, the world's knowledge is scattered across billions of sites and we find things based on keywords. Metaphor will organize this knowledge into an intelligent database and we'll find things based on meaning. For example, keywords can't handle these types of queries, we won't merely have a better search engine — rather, we'd need more people to help us achieve this very sci-fi future, and we need more people to help us achieve this very sci-fi future.

Is it free?
